```
CC This invention describes a novel sphingolipid desaturase that selectively CC introduces a double bond into the sphingobase of the ceramide residue of csphingolipids and capnoids. A DNA sequence encoding the sphingolipid CC desaturase, or a vector containing the DNA sequence, can be used to CC produce transgenic plants, especially crop plants, with an increased or CC decreased delta-8-unsaturated long-chain base content or an altered CC delta-8-unsaturated long-chain base content or an altered CC compensate for a delta-8-unsaturated long-chain base deficiency, to CC exclude production of delta-8-unsaturated long-chain base deficiency, to CC conditions, cold or frost and/or phytopathogenic microases tolerance CC or resistance to soil salinity, ion stress or toxicity, drought, wet CC conditions, cold or frost and/or phytopathogenic microorganisms, or to CC alter size growth and flowering time. Cells, transgenic organisms or CC can be used in cosmetics, pharmaceuticals and foods and as chemical raw CC can be used in cosmetics, pharmaceuticals and foods and as chemical raw CC described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                New aphingolipid desaturase that selectively introduces double bond into sphingolipids and capnoids -

                                                                          á
                                                                                                                밁
                                                                                                                                            Ş
                                                                                                                                                                                                                                                         This invention describes a novel sphingolipid desaturase that selectively controduces a double bond into the sphingolipid desaturase of the ceramide residue of sphingolipids and capnoids. A DNA sequence encoding the sphingolipid codesaturase, or a vector containing the DNA sequence, can be used to compound the sphingolipid codecreased delta-8-unsaturated long-chain base content or an altered codelta-8-unsaturated long-chain base content or an altered codelta-8-unsaturated long-chain base cis/trans ratio, especially to compensate for a delta-8-unsaturated long-chain bases, to increase tolerance codecreased efficiency, to compensate for a delta-8-unsaturated bases, to increase tolerance corresistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms or to calter size growth and flowering time. Cells, transgenic organisms or compensation containing the DNA sequence can be used to produce sphingolipids can decontain cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence encodes the Brassica napus sphingolipid desaturase sldl protein described in the method of the invention.
                                                                                                                                                                                   Query Match

This invention describes a novel sphingolipid desaturase that selectively CC introduces a double bond into the sphingobase of the ceramide residue of sphingolipids and capnoids. A DNA sequence encoding the sphingolipid CC sphingolipid and capnoids. A DNA sequence, can be used to CC produce transgenic plants, especially crop plants, with an increased or CC decreased delta-8-unsaturated long-chain base content or an altered CC compensate for a delta-8-unsaturated long-chain base deficiency, to CC compensate for a delta-8-unsaturated bases, to increase tolerance CC or resistance to soil salinity, ion stress or toxicity, drought, wet CC conditions, cold or frost and/or phytopathogenic microorganisms, or to alter size growth and flowering time. Cells, transgenic organisms or CC alter size growth and flowering time. Cells, transgenic organisms or CC plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence encodes the Arabidopsis thaliana sphingolipid desaturase sldl protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and

The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polymucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 growth, 17 days after full bloom. The average werry was 6 milimeters. Sampled vines were located at the University of California, Davis, Experimental Vineyard. cDNAs were made by oligo-dT priming and directionally cloned. 5'and 3' adaptors were used in cloning as follows: 5'-AARGCAGTGGTATCAACGCAGAGTGGCCATTACGGCCGGG-3' and 5'-ATTCTAGAGCCCGAGCGCCATTG-dT(30)NN-3'. Library was constructed using the Clontech Creator SMART kit and size-selected to contain the 0.5-3 kb size fraction." a 131 c 168 g 251 t

Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_LIB=QG_ABCDI lettuce salinas
                                                                                                                                                              /clone_lib="QG_ABCDI lettuce salinas"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note="Vector: pBluescript SK-; Site 1: EcoRI; Site 2: XhoI; cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in SOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /clone="HOGA-29M7"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= wector: pBluescript SK-; Site_1: EcoRI; Site_2: XhoI; Immature seeds, collected from pods ranging in age from 11 to 19 days after pollination, were harvested from greenhouse-grown plants. Seeds were removed and separated from pod walls and were immediately frozen in liquid nitrogen. Seeds throughout the age range were pooled for mRNA extraction. CDNA was prepared from polyA-enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-asssist helper phage and propogated in
